a textbook with a hands on approach that leads students through the gradual construction of a complete and working computer system including the hardware platform and the software hierarchy in the early days of computer science the interactions of hardware software compilers and operating system were simple enough to allow students to see an overall picture of how computers worked with the increasing complexity of computer technology and the resulting specialization of knowledge such clarity is often lost unlike other texts that cover only one aspect of the field the elements of computing systems gives students an integrated and rigorous picture of applied computer science as its comes to play in the construction of a simple yet powerful computer system indeed the best way to understand how computers work is to build one from scratch and this textbook leads students through twelve chapters and projects that gradually build a basic hardware platform and a modern software hierarchy from the ground up in the process the students gain hands on knowledge of hardware architecture operating systems programming languages compilers data structures algorithms and software engineering using this constructive approach the book exposes a significant body of computer science knowledge and demonstrates how theoretical and applied techniques taught in other courses fit into the overall picture designed to support one or two semester courses the book is based on an abstraction implementation paradigm each chapter presents a key hardware or software abstraction a proposed implementation that makes it concrete and an actual project the emerging computer system can be built by following the chapters although this is only one option since the projects are self contained and can be done or skipped in any order all the computer science knowledge necessary for completing the projects is embedded in the book the only pre requisite being a programming experience the book s web site provides all tools and materials necessary to build all the hardware and software systems described in the text including two hundred test programs for the twelve projects the projects and systems can be modified to meet various teaching needs and all the supplied software is open source

introduction to computing systems from bits gates to c beyond now in its second edition is designed to give students a better understanding of computing early in their college careers in order to give them a stronger foundation for later courses the book is in two parts a the underlying structure of a computer and b

programming in a high level language and programming methodology to understand the computer the authors introduce the Ic 3 and provide the Ic 3 simulator to give students hands on access for testing what they learn to develop their understanding of programming and programming methodology they use the c programming language the book takes a motivated bottom up approach where the students first get exposed to the big picture and then start at the bottom and build their knowledge bottom up within each smaller unit the same motivated bottom up approach is followed every step of the way students learn new things building on what they already know the authors feel that this approach encourages deeper understanding and downplays the need for memorizing students develop a greater breadth of understanding since they see how the various parts of the computer fit together

a new and extensively revised edition of a popular textbook used in universities coding boot camps hacker clubs and online courses the best way to understand how computers work is to build one from scratch and this textbook leads learners through twelve chapters and projects that gradually build the hardware platform and software hierarchy for a simple but powerful computer system in the process learners gain hands on knowledge of hardware architecture operating systems programming languages compilers software engineering and relevant algorithms and data structures using this constructive approach the book introduces readers to a significant body of computer science knowledge and synthesizes key theoretical and applied techniques into one constructive framework the outcome is known as nand to tetris a journey that starts with the most elementary logic gate called nand and ends twelve projects later with a general purpose computer system capable of running tetris and any other program that comes to your mind the first edition of this popular textbook inspired nand to tetris courses in many universities coding boot camps hacker clubs and online course platforms this second edition has been extensively revised it has been restructured into two distinct parts part i hardware and part ii software with six projects in each part all chapters and projects have been rewritten with an emphasis on separating abstraction from implementation and many new sections figures and examples have been added substantial new appendixes offer focused presentation on technical and theoretical topics

the emerging trends in computing have increasingly had a network centric focus networked services offered through cloud computing paradigms have replaced applications that would traditionally run on local machines in addition the growing usage of applications such as social networking and platforms such as smartphones has resulted in greater need for ubiquitous network access the consequent heightened demand for networked computing warrants efficient utilization of the limited network resources and more intelligent resource control algorithms with a focus on providing an enhanced user experience this thesis examines quality of service aware resource control for both wireless and wired networks the first part of the thesis focuses on smartphones which have become the de facto mobile computing platform a smartphone typically has access to multiple types of wireless networks such as cellular networks and wifi moreover the functionality of smartphones can be expanded by installing applications these two core characteristics of smartphones also reveal their most significant limitations lower available bandwidth and limited computing power both of these limitations are addressed in this thesis available bandwidth on wireless networks fluctuates over time and is also shared among all users connecting to the same

base station in this work we present a dynamic bandwidth prediction model that makes short term predictions on the evolution of bandwidth the model is dynamic and adjusts to the latest measurements provided by zeus a bandwidth measurement tool we designed and implemented on nokia phones the bandwidth predictions of our model are utilized in a novel rate control scheme which we demonstrate to offer better performance than existing schemes we next investigate the computing limitations of smartphones a novel framework is considered where computational tasks may be transferred to a central server and the results are fetched back at a later time the central server has ample computing resources compared to the smartphones and the computing speedup outweighs the communication delays the goal is to minimize the latency experienced by computational tasks while judiciously utilizing the scarce memory resources available at the smartphone given the fluctuating nature of wireless bandwidth there is a tradeoff between limited connectivity and congestion at the mobile the second part of this thesis investigates resource control issues in wireline computing and more specifically in packet switches packet switches are essential parts of the internet backbone and are also present in every data center modern data centers are severely constrained by their power consumption and power saving schemes would enable their further expansion we propose novel power aware scheduling algorithms for switches that offer significant power savings while sacrificing minimal performance finally we examine a novel scalable two stage ingress memory switch architecture and we add backlog awareness to the scheduling algorithm to improve performance and fairness as perceived by the user
